

APPENDIX 1

The choice of evaluation for the JEFF-3.1 Neutron General Purpose Library with comparison of the origin of the JEFF-3.0 evaluations is presented below, including some background information about the JEFF-3.1 project. This document was prepared by A.J. Koning, NRG Petten, during the compilation of the library.

Contents of General Purpose Library JEFF-3.1

This section discusses the selection of isotopes for the JEFF-3.1 neutron general purpose file. The procedure for this is reminiscent to that of the JEFF-3.0 library. The contents of the JEFF-3.0T starter file were proposed in 1996 in a document by John Rowlands [row96]. For each nuclide for which evaluations, in any data library, were available, he proposed a best evaluation for JEFF-3.0, keeping in mind the most important application of each nuclide. According to John Rowlands, "the judgement about "best" is based on the date of the evaluation and its completeness". The resulting selection was then discussed at the JEFF meeting and after several changes the JEFF-3.0T starter file was ready. What followed was a few years of solving format problems, testing and benchmarking, leading to the release of JEFF-3.0 in April 2002. A similar procedure has now been followed for the JEFF-3.1 data library. In most cases, the reasons outlined in [row96] to prefer one evaluation over the other are still valid. In other cases, new evaluations have appeared, and the choice was reconsidered. This section contains a table which specifies the data file for each isotope in JEFF-3.1, together with its justification. For the selection process, basically 4 rules were put into practice:

1. Include new European evaluations that have emerged since the release of JEFF-3.0.
2. As the default upgrade, adopt newer versions of evaluations that have been selected for JEFF-3.0: if for JEFF-3.0 an isotope was selected from e.g. JENDL-3.2, then adopt JENDL-3.3 for the same isotope in JEFF-3.1 (provided the JENDL-3.3 evaluation is an improvement!).
3. Choose source evaluations for JEFF-3.1 other than those of JEFF-3.0 if there are reasons to do so. This would overrule 2.
4. There were still 17 evaluated isotopes in other libraries that are not included in JEFF-3.0 (e.g. Nb-94,Fm-255). They are adopted.

The existing available data libraries in the world, JEFF-3.0, ENDF/B-VI.8, ENDF/B-VIIb0 (preliminary version), JENDL-3.3, EFF-2.4, EFF-3.0, BROND-2.2, and CENDL-2.1 have been scanned to come to the choice detailed in the table below. As additional guidelines, use has been made of the following references:

The table below displays the resulting selection for the 381 materials (374 nuclides and 7 elements) that are included in JEFF-3.1.

Explanation of the table

The first column 'Isotope' lists all isotopes included in JEFF-3.1. Note that it includes, as a sort of warning, the stable isotopes that do not exist in JEFF-3.1, nor in any other library, such as e.g. the Ne and Yb isotopes.

The second column 'JEFF-3.0' specifies the source of the evaluation adopted in JEFF-3.0. This is basically equal to "Rowlands' list" [row96].

The third column 'JEFF-3.1' specifies the evaluation adopted in JEFF-3.1. If this column contains 'JEFF-3.0' there is thus no change.

The fourth column 'S' specifies whether an isotope is a stable nuclide (S) or not (blank).

The fifth column 'E' specifies the maximum energy of the evaluation in MeV.

The sixth column 'Justification/Comments' gives a short justification for the upgrade for JEFF-3.1 or other comments.

The seventh column 'Change' contains a '*' if a different source library than that of JEFF-3.0 is adopted (rule 3 above), an 'n' if the isotope did not exist in JEFF-3.0 (rule 4) and an 'N' if a new evaluation for JEFF-3.1 is made (rule 1).

From As (Z=33) to Er (Z=65), the choice is often accompanied the comment "More recent evaluations available". This generally concerns fission products. We still use JEFF-3.0 for these, although other evaluations (usually JENDL-3.3) are much more complete and more recent. Many of the FP evaluations of JEFF-3.0 (mostly taken from JEF-2.2, which are often based on ENDF/B-V) are however validated or even post-adjusted to various integral experiments (e.g. reactivity worth) such as STEK. Note that for a few FP's (e.g. Cs-133), detailed studies have already led to clear recommendations, as indicated in the table below. For future releases of the JEFF library, the results of WPEC subgroup 23 on fission product evaluationsll serve as a helpful guideline.
